

Thrashing

Overcommitted system

when OS spent most of the time in paging data back and forth from disk (and so spending little time doing useful work)

- The problem comes from either
 - a bad page replacement algorithm
(that does not help minimizing page fault)
 - or not enough physical memory for all processes

Windows XP Paging Policy

➔ Local page replacement

- Per-process FIFO
- Processes start with a default of 50 pages
- XP monitors page fault rate and adjusts working-set size accordingly
- On page fault, cluster of pages around the missing page are brought into memory
