

# Implementing VMMs - requirements

## **Fidelity**

OSes and applications work the same without modification (although we may modify the OS a bit)

## **Isolation**

VMM protects resources and VMs from each other

## **Performance**

VMM is another layer of software

...and therefore overhead (that needs to be minimized)

# What needs to be virtualized?

Exactly what you would expect

- CPU
- Events (hardware and software interrupts)
- Memory
- I/O devices

Isn't this just duplicating OS functionality in a VMM?

- (yes) approaches will be similar to what we do with OSes  
simpler in functionality, though (VMM much smaller than OS)
- (and no) but implements a different abstraction  
hardware interface vs. OS interface
