

Threads within a process

Our web server becomes

```
web_server() {  
    while (1) {  
        int sock = accept();  
        thread_fork(handle_request, sock);  
    }  
}  
  
handle_request(int sock) {  
    Process request  
    close(sock);  
}
```
